

AMENDMENTS TO THE SPECIFICATION

On page 16 of the Application, as filed, please amend the Abstract as follows:

A signal cable ~~structure which automatically reduces or substantially eliminates selective frequency time shifting. The cable uses a unique cable~~ lead structure in which ~~the leads~~ each lead inside the cable ~~[[are]]~~ is formed in a generally rectangular shape such that current passing through each segment of the ~~signal cable lead~~ lead is traveling in the opposite direction from current passing through an adjacent segment of the ~~signal cable same lead~~. As the signal is passing through the signal cable, the magnetic fields generated in each segment of the ~~signal cable cancel lead cancels~~ out the magnetic fields in adjacent segments of the lead. ~~The cancellation of the magnetic fields eliminates the impedance which causes the selective frequency time shifting to occur.~~ In signal cables having multiple leads, the leads are arranged such that they are offset from one another to maximize the distance between the leads ~~reduce cross wire interference~~, and also rotated in relation to one another to further ~~reduce cross wire interference~~ maximize the distance between the leads.
